Overview of the Nobel Prize in Physics 2010

The Nobel Prize in Physics is one of the most prestigious awards in the scientific community, recognizing outstanding contributions in the field of physics. In 2010, the prize was awarded to Andre Geim and Konstantin Novoselov, who conducted their groundbreaking research at the University of Manchester. Their work focused on graphene, a single layer of carbon atoms arranged in a two-dimensional lattice. This discovery not only opened new avenues of research but also demonstrated the profound impact that basic science can have on technology and society.

The Nobel Committee highlighted the innovative methods used by Geim and Novoselov to isolate graphene, which involved a simple yet effective technique known as mechanical exfoliation. This method allowed them to peel off layers of graphite to obtain graphene sheets, a process that appeared deceptively straightforward yet required a deep understanding of material properties. Their successful isolation of graphene has since inspired a global wave of research that continues to this day.

Details about the laureates: Andre Geim and Konstantin Novoselov

Andre Geim and Konstantin Novoselov are both Russian-born physicists who have made significant contributions to the field of condensed matter physics. Their collaboration began in the early 2000s at the University of Manchester, where they embarked on a project to explore the properties of graphene.
